

## WESTCARB Annual Meeting

September 15-17, 2009  
Scottsdale, Arizona

### Northern California CO<sub>2</sub> Reduction Project

**Edward Hymes**  
Project Manager  
Shell International Exploration and Production

**Sean McFadden**  
Technical Team Leader  
Shell International Exploration and Production

**John Henry Beyer**  
WESTCARB Program Manager  
Lawrence Berkeley National Laboratory

## Shell / Lawrence Berkeley Lab Collaboration

- LBNL and Shell project teams first met in June 2008 to discuss the possibility of working together
- We agreed on a new project site in Solano County near the SW edge of the Sacramento Basin
- Shell has worked on regional and site-specific geologic characterization, CO<sub>2</sub> injection, well design, and field logistics and operations
- LBNL has developed a detailed test plan adapted to the site and depth of interest

## Permits & Agreements

- Surface and subsurface access – Agreement signed between landowner and Shell in mid April 2009
- UIC permit for Class V, Experimental – With support from Sandia Technologies, Shell submitted application to EPA Region 9 in August 2009 after data gathering, subsurface modeling, and well design
- DOE Environmental Questionnaire – Aspen Environmental is finalizing the NEPA documentation
- Land use permits – Shell has clarified requirements and are developing the application for submission

## Public Outreach

- Conducted research to gain an understanding of the community
- Issued a press release
- Engaged with local stakeholders
- Developed information materials
- Updated WESTCARB website with project information
- Established an information phone line

**PUBLIC MEETING**  
**Storing Carbon Dioxide to Fight Global Warming: California CO<sub>2</sub> Saline Reservoir Storage Test**

**Purpose**  
This informational meeting is being held to discuss plans for a research project to use "carbon sequestration," a promising new technology that can keep carbon dioxide (CO<sub>2</sub>) away from the atmosphere to curb global warming. This focus is CO<sub>2</sub> capture and storage, which sequestration involves adding gas separation equipment at large industrial facilities, such as power plants, refineries, and cement plants, to remove CO<sub>2</sub> that would otherwise be emitted with the gas. The "captured" CO<sub>2</sub> is compressed and injected about 1/2 of a mile underground into suitable geologic formations for long-term storage.

Deployed oil and gas reservoirs and similar formations filled with seawater that cannot be made potable, such as those present in the Delta, are excellent candidates for safe and secure CO<sub>2</sub> storage. As a potential co-benefit, new natural gas may be produced in conjunction with the CO<sub>2</sub> injection.

Everyone is welcome to attend the meeting to learn and ask questions about our proposed project. (Please see our Q & A section on the back of this announcement.)

## WESTCARB Program Objectives for the Northern California CO<sub>2</sub> Reduction Project

Overall goal: Gain practical experience in and demonstrate the potential for CO<sub>2</sub> storage in deep geologic formations in settings with large CO<sub>2</sub> sources and storage potential.

- Demonstrate the safety and feasibility of CO<sub>2</sub> storage in saline formations in the northern regions of California's vast Central Valley
- Analyze chemical interactions among CO<sub>2</sub>, formation brine, and reservoir rock
- Demonstrate and test methods for monitoring geologic CO<sub>2</sub> storage
- Gain experience with regulatory permitting, landowner issues, and public outreach associated with geologic storage of CO<sub>2</sub> in California

5

## Western Sacramento Valley Location

### Viable Pilot Test Site

- Capacity to trap CO<sub>2</sub> is adequate for planned volume
- Leak potential is low due to scarcity of faults and old wells; thick, multiple shale seals
- Terrain and land ownership appears to be favorable

### Uncertain issues to be determined

- Salinity possibly ~10,000 ppm in shallower sandstones
- Permeability uncertainty at injection depth – axis of syncline is deep
- Sand continuity in the syncline is unknown

6

## Site Characterization by Shell Technical Team

- **Geologic characterization:** stratigraphy, hydrogeology, salinity estimates. Offset log data: reservoir structure, thickness, sand/shale ratios, porosity, permeability, overlying seals (shales), lateral continuity, temperature, mechanical/rock properties, pore pressure
- **CO<sub>2</sub> injection simulation** for a range of permeabilities, porosities, and CO<sub>2</sub> quantities: injectivity, plume size, injection volume and duration, distance between injection and monitoring wells.
- **Analyze water injection tests:** mini/micro frac, step rate test, and pressure transient test at different permeabilities
- **Logging and coring program**
- **Model time-lapse walk-away VSP:** data acquisition, survey geometry, cost, signal-to-noise
- **Well design options and costs:** monitor well placement; directional control during drilling, well separation control
- **Logistics for completions and testing:** completion design, scheduling and sequence of field operations, with cost implications

## Analysis of offset log and core data

### Type Stratigraphy

|                        |
|------------------------|
| Nortonville shale      |
| Domengine sand         |
| Ione/Capay shale       |
| Hamilton sand          |
| Meganos shale          |
| Anderson sand          |
| Anderson shale         |
| Martinez sand          |
| Martinez Shale         |
| Martinez Complex sands |
| Deeper sands and Seals |

Model showing general thickening along the axis of the syncline

Source: Shell

### Attributes of target formation extrapolated from nearby wells (2 miles)

- Thick sand package with thick shale above
- Multiple clean sands with low shale content
- Caliper and resistivity logs show fluid invasion indicating permeability
- Average porosity 18%
- Laterally continuous sands
- Sands are compacted and do not wash out
- Likely high salinity
- Good regional containment, no nearby outcrops or known faults
- Option to plug back to shallower formations if needed

### Concerns

- Deep, >10,500 feet
- Possible low permeability & porosity

## Stratigraphic column

Source: Shell

## Project Scope

Source: Shell

## Pilot Project Test Plan

- Model CO<sub>2</sub> injection and multiphase CO<sub>2</sub>/ formation water movement
- Assess injectivity and safe injection pressure with analysis of downhole pressure from step-rate injection, micro frac, and build-up tests
- Obtain fluid samples in rapid succession at reservoir pressure with U-Tube system during CO<sub>2</sub> injection test
- Use tracers to assess supercritical and dissolved phases of CO<sub>2</sub>
- Measure geochemical interactions of CO<sub>2</sub> with reservoir brine and rock
- Monitor subsurface CO<sub>2</sub> movement and trapping using VSP and cross-well seismic before and after CO<sub>2</sub> injection
- Lab study of seismic velocity of CO<sub>2</sub>-saturated core
- Run RST and DTSP logs to monitor CO<sub>2</sub> and demonstrate well integrity
- Analyze geomechanics and monitor possible induced seismic activity
- Estimate reservoir storage capacity
- Calibrate and validate multiphase flow models

11

## Transient analysis of step-rate test (SRT) data

SRT used to define the formation parting pressure (FPP), the maximum injection pressure without fracturing the formation

Singh, P. K., R. G. Agarwal, and K. D. Krase, 1987, Systematic design and analysis of step-rate tests to determine formation parting pressure, SPE paper 16798, 62nd ATCE of SPE, Dallas, TX, September 27-30, 1987.

### Transient analysis of SRT

- Use the same SRT data
- More accurate identification of FPP
- Reduce the maximum injection pressure during test
- Reduce the volume of fluid injected
- Produce estimates of the storativity transmissivity, skin factor

Silin, D. and G. Robin, 2009, Combining step-rate well test with transient pressure test: is it possible?, SPE paper 121425, 2009 SPE Western Regional Meeting, San Jose, CA, March 24-26, 2009.

12

## U-Tube System for fast fluid and tracer sampling

U-Tube surface module

High pressure control valves

Pressurized sample storage

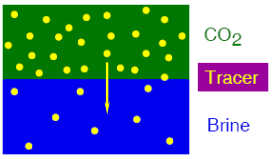

U-tube and check valve strapped to production tubing

13

## Geochemistry of geologic sequestration: CO<sub>2</sub>-brine-mineral interactions

- Multiple phase partitioning tracers (noble gases [Kr, Xe], SF<sub>6</sub>, volatile organic chemicals) injected with CO<sub>2</sub>. From known phase partitioning behavior (solubility, volatility):
  - Infer the average volume fractions of different fluid phases along the flow path
  - Determine reservoir processes and conditions (phase saturations, fracture-matrix interaction, exchange geometry)
  - Identify fast preferential paths
- Geochemical interactions of CO<sub>2</sub> with formation brine and rock
  - Changes in chemical and isotopic composition of fluid along a flow path reflect
    - > Mixing
    - > Mineral dissolution
    - > Precipitation
  - Reactive transport models quantify these competing processes

Model (Code) Complexity

Fluid dynamics: TOUGH2

- Multiphase flows of water/NCGs/dissolved solutes/non-isothermal
- Investigate reservoir dynamics and testing

Geochemistry: TOUGHREACT

- Reactions between gas - aqueous - solid phases
- Study natural and induced chemical evolution of fluid-rock system

Geomechanics: TOUGH-FLAC

- TOUGH2 coupled to commercial FLAC3D geomechanics code
- Stress-strain: analyze uplift and subsidence, permeability change

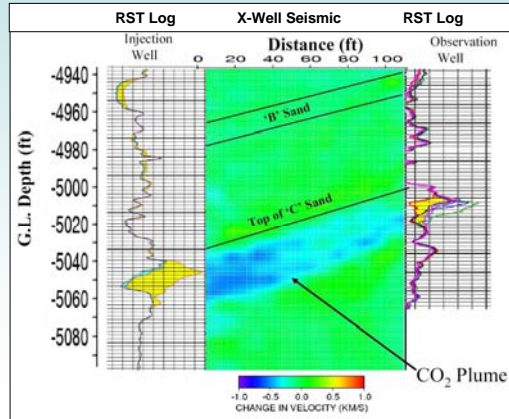

14

## Seismic Imaging of the CO<sub>2</sub> Plume

- Time-lapse crosswell
- Time-lapse vertical seismic profile (VSP)
- Resonance bar study of core samples

Crosswell raypaths

Crosswell Survey, Frio Brine CO<sub>2</sub> Pilot, Texas

Source: Tom Daley, LBNL

15

## VSP Survey Analysis

Seismic velocity change with CO<sub>2</sub> saturation

Ray tracing for VSP offset planning

Source: Tom Daley, LBNL

Velocity model for CO<sub>2</sub> simulation

Source: Shell

At the Frio Brine CO<sub>2</sub> Pilot, VSP detected the plume extent at a depth of 5,000 feet.

Modeling results: At a depth of 11,000 feet, the acoustic impedance change from CO<sub>2</sub> saturation should be detectable using VSP surveys.

16

## Modified Split Bar Hopkinson Pressure Bar Apparatus

Measures resonance of bar + sample system

**Measurements of elastic moduli in the 500-1000 Hz range**

Can extract Q, works for small samples

Source: Seiji Nakagawa, LBNL

17

## Distributed Thermal Perturbation Sensor (DTPS) for Tracking CO<sub>2</sub> Migration in the Subsurface

Good overall fit to baseline results (e.g., anhydrite marker horizon).

Distinct zone with decrease in thermal conductivity: main zone of CO<sub>2</sub> injection

From Jan Henniges, GFZ, Barry Freifeld, LBNL, and the CO<sub>2</sub>SINK Scientific Monitoring Team
